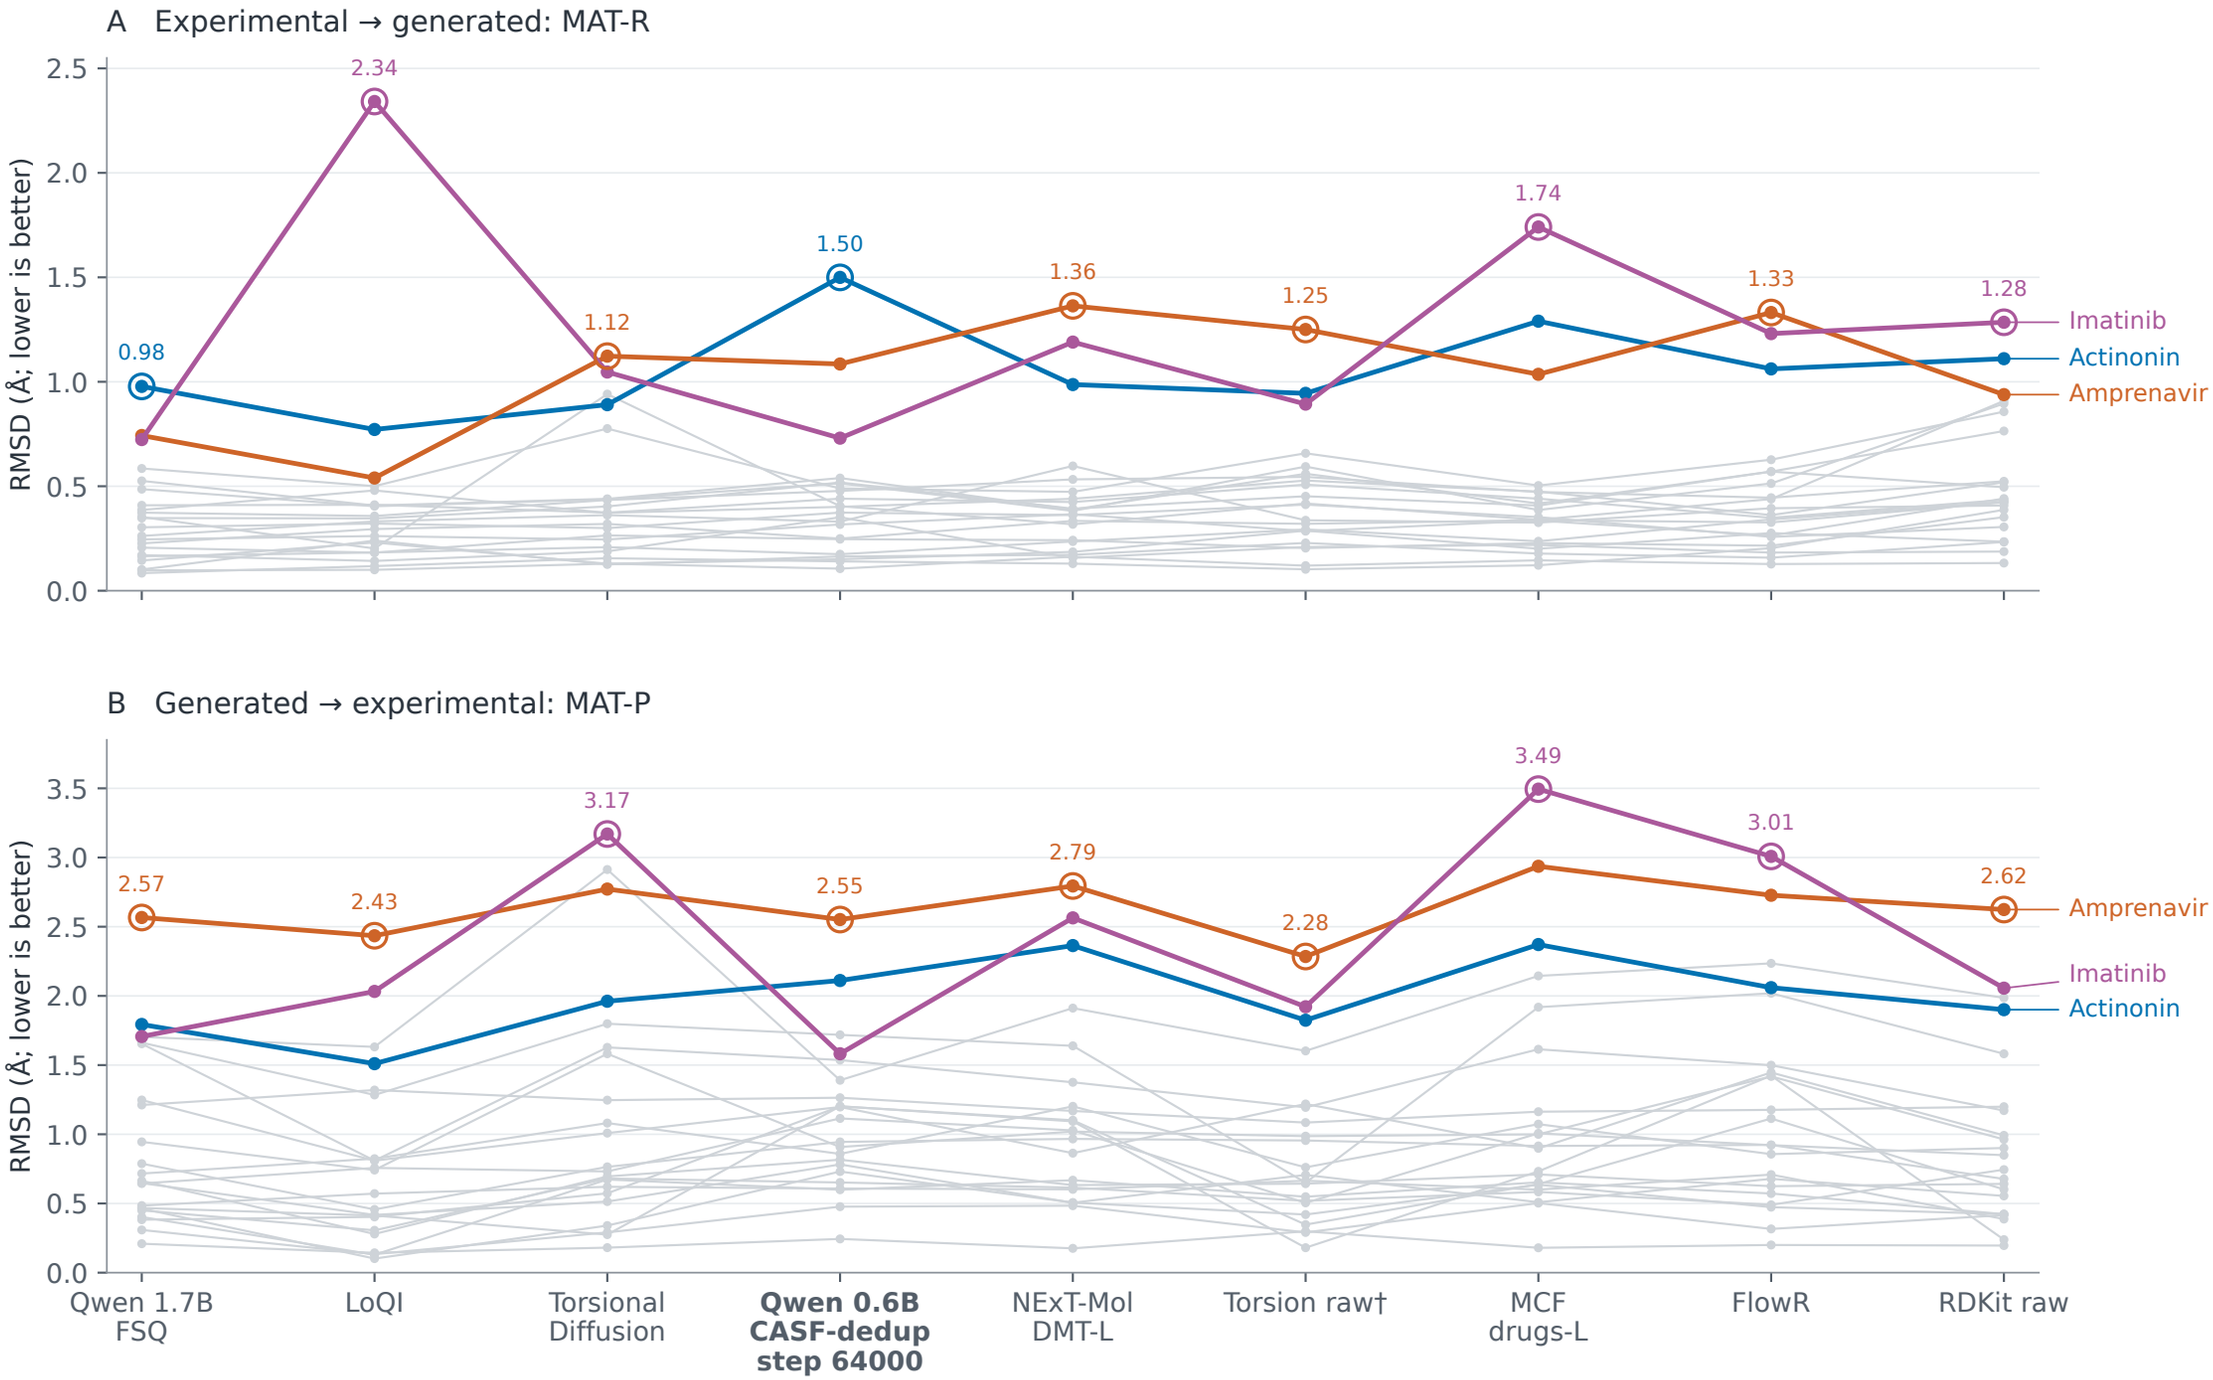
Tracking individual molecules across conformer generators

PLINDER-22 · one connected line per molecule · the same molecule keeps its color in both panels

Three molecules are worst for at least one method (colored); the other 19 are grey. New Qwen run is bold.



Outlined markers identify each method’s largest distance; numbers give that molecule’s value in Å.

Full supplied ensembles; no common PoseBusters filter. † Torsion raw starts from an experimental conformation.

Methods are categorical, ordered by mean MAT-R. Connecting lines track identity, not a continuous trend.
