How representation and model size change conformer matching

One point per molecule; positive values mean a lower matching distance.

Representation: binned → FSQ

Model size: 0.6B → 1.7B

CASF: per-ligand minimum RMSD after PB filtering, 1,000-candidate target. PLINDER: per-molecule MAT-R on full supplied pools.
Axis ranges are identical between rows within each dataset. Dotted boxes mark the CASF zooms; full panels retain all molecules.
