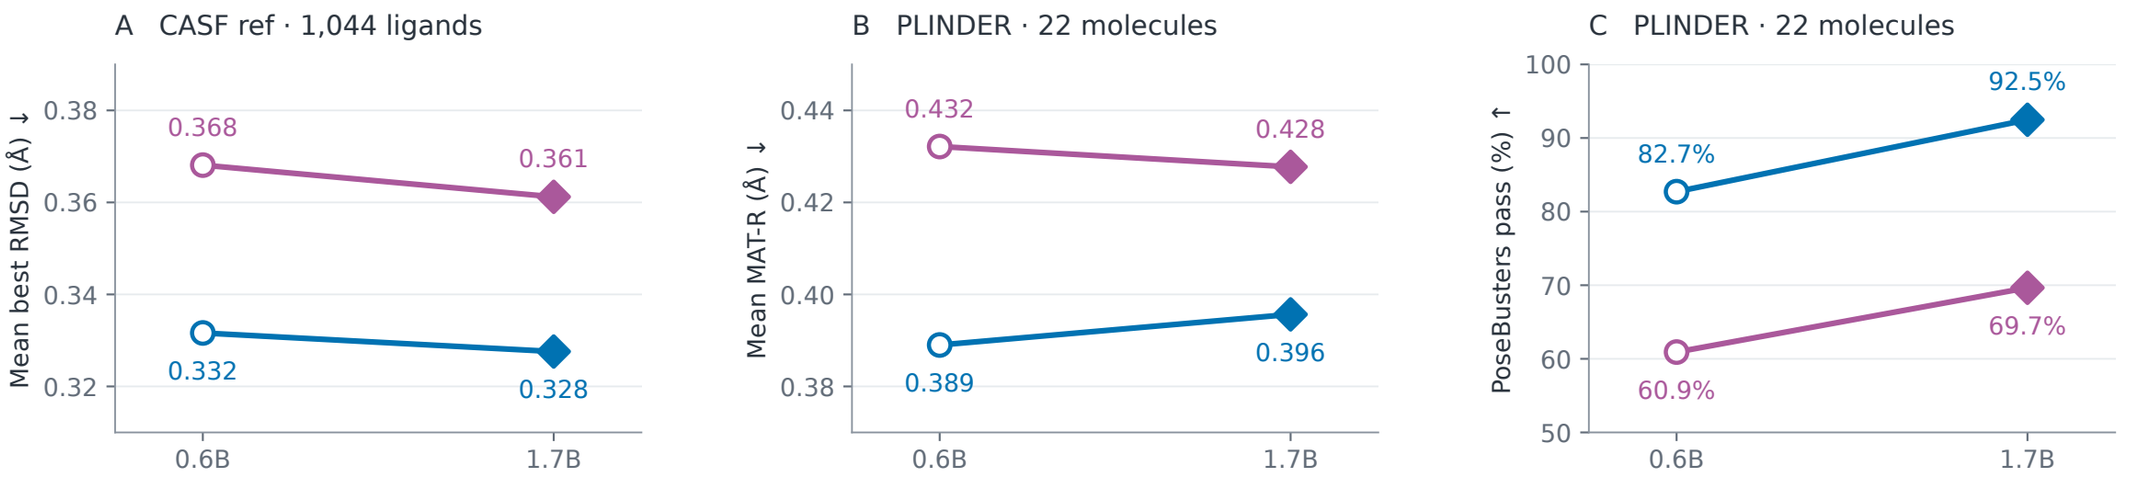
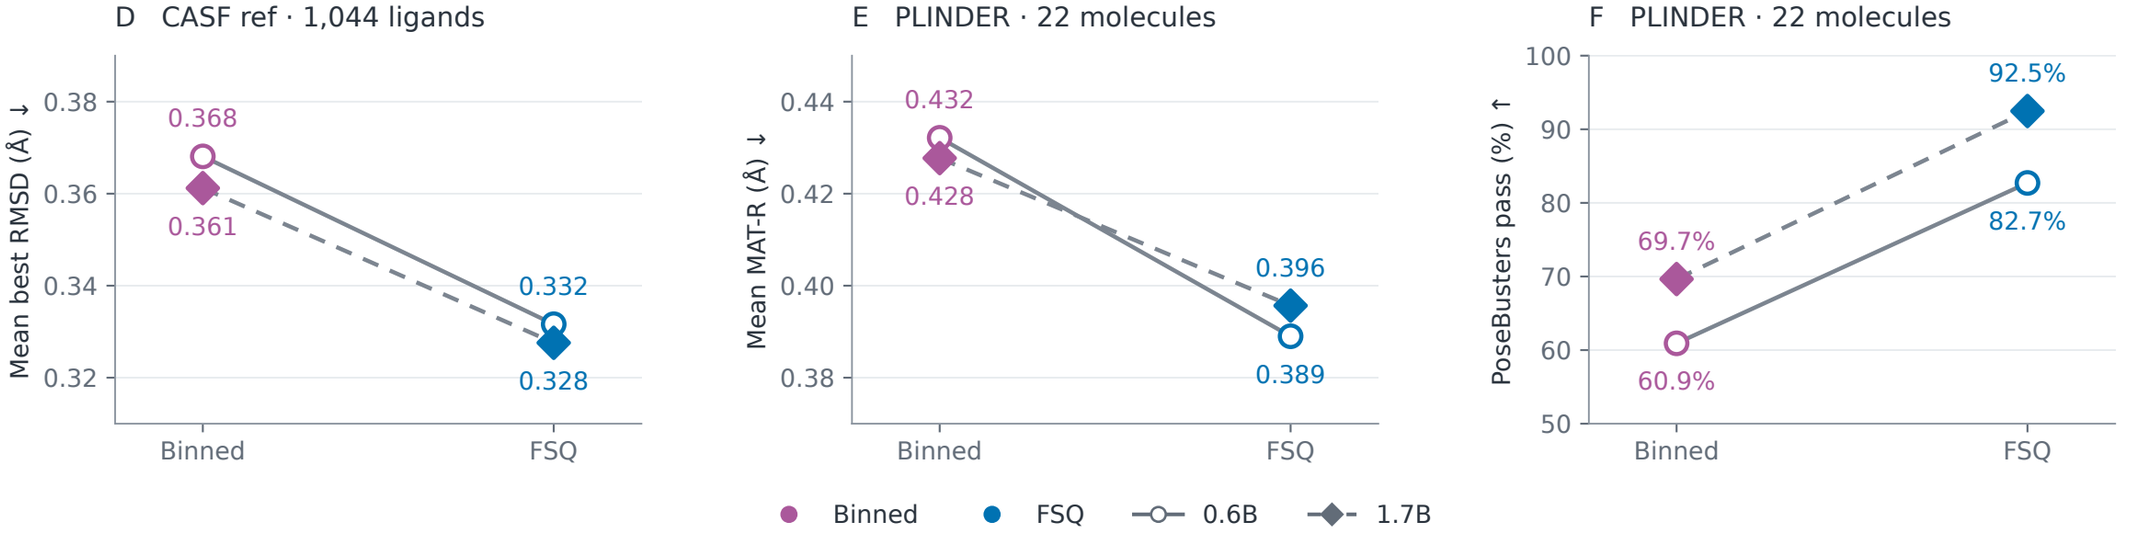
Model size and representation affect different aspects of generation

The same four configurations, compared by size above and by representation below.

Model size: 0.6B → 1.7B



Representation: binned → FSQ



CASF: PB-filtered ensembles, 1,000-candidate target. PLINDER: full supplied pools; PB measured separately.

Matching distances are means across molecules; PB is the pooled pass rate. Each column uses the same truncated y-axis in both rows.
